

Fig. 2.8. Plan of Building B2.

Fig. 2.9. Stone mortar found in situ (L345, field no. 3227/8).

Fig. 2.10. A complete (smashed) MB I krater found in situ (L372, field no. 3216/1).

These inner rooms were not paved and were probably floored by compact earth. The findings from the rooms were comprised of the above-mentioned *in situ* complete MB III/LB I krater (L372, field no. 3216/1), and sherds of bowls, lamps, cooking pots and storage jars. In addition, as mentioned above a stone mortar was also found *in situ*. The artifacts date to the MB I–II and LB I periods.

West of Building B2 and along the same axis was an additional room (L370), which appears to

have comprised one element in what was a partially-paved building complex abutting Building B2. This complex had been partially dug during IAA testing (Torga's Square E1). Room L370 measured 3.7 x 2.7m and its floor was paved with small and medium-sized stones. The southern (WA1411, 3.5 x 0.8m) and western (WB131, 4.75 x 0.8m) walls of this room were built of large stones, one course wide and high. The Room L370 findings included sherds of MB and LB bowls, cooking pots, storage jars, a jug, and a stand.
